Who Comes Back?

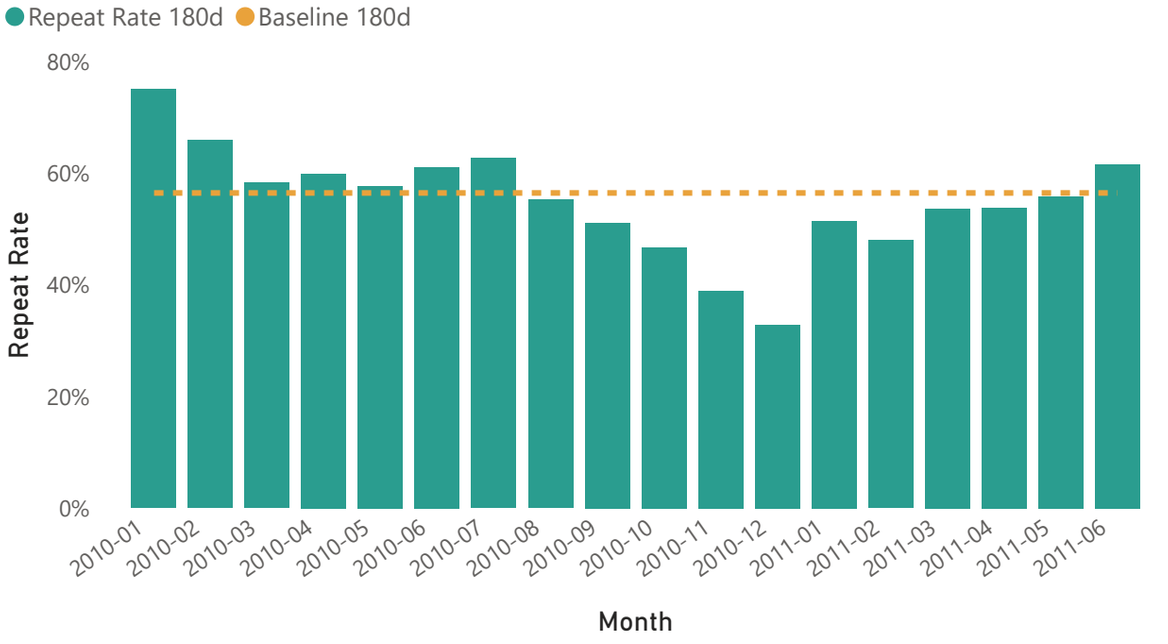

country

Total Revenue	Customers	Orders	Avg Order Value
£16.92M	5,824	32,173	£526

Revenue by Month

180 Day Repeat Rate By First Order-Month

Takeaways

- Revenue builds through the autumn in both years because shops stocking up before Christmas, and more new customers arrive in the autumn months.
- The dashed line is the average repeat rate (56%). Some of the late 2010 months(October to December), sit well below it, so people who first bought around Christmas came back less often which implies that they were seasonal buyers who stocked up once

2011-02	16.00%	18.40%	16.00%	
2011-03	17.88%	20.11%	20.67%	
2011-04	24.53%	19.81%	17.92%	
2011-05	23.42%	16.22%	26.13%	

Seasonality Note

Customers who first bought in September or October came back more often the next month. 23% and 26% in 2010, and 27% and 32% in 2011. That pattern repeated in both years, which fits shops stocking up before Christmas.

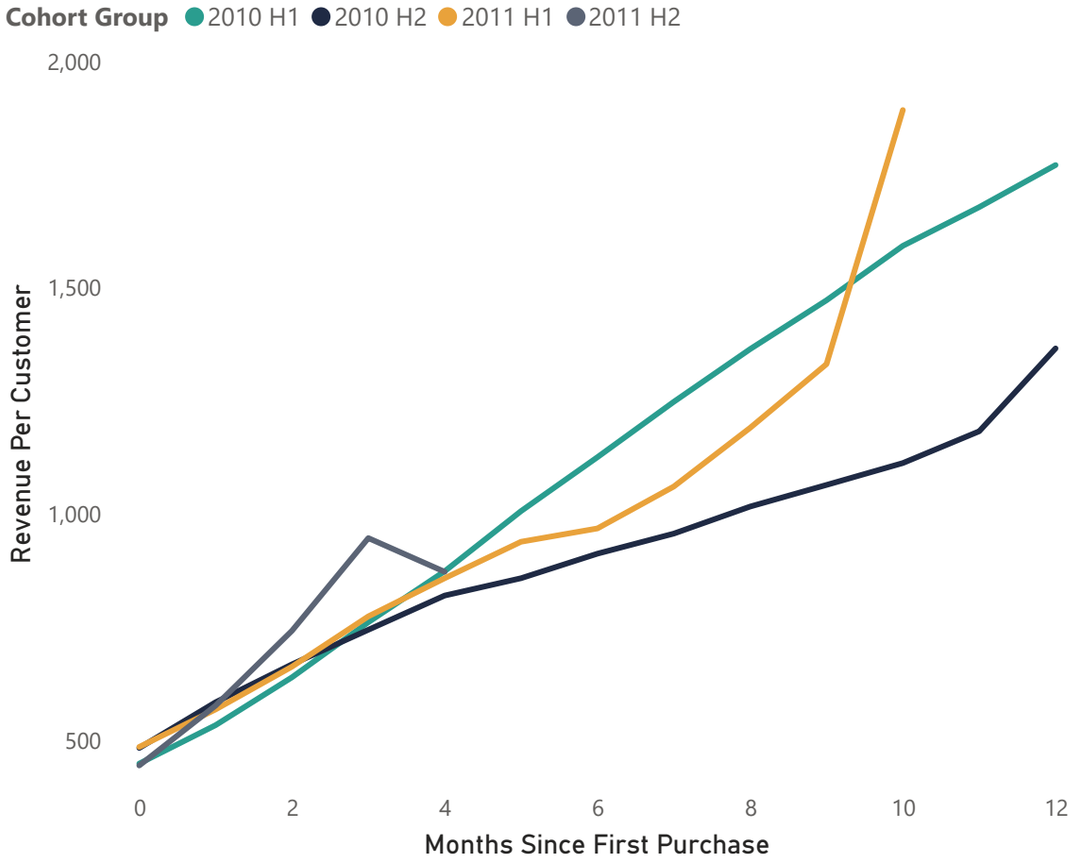

Reading The Matrix

- Each row is a group of customers who first bought in that month.
- Each column shows what share of them ordered again 1, 3, 6 or 12 months later.
- Darker means more customers came back.
- Blank cells mean not enough time has passed yet.

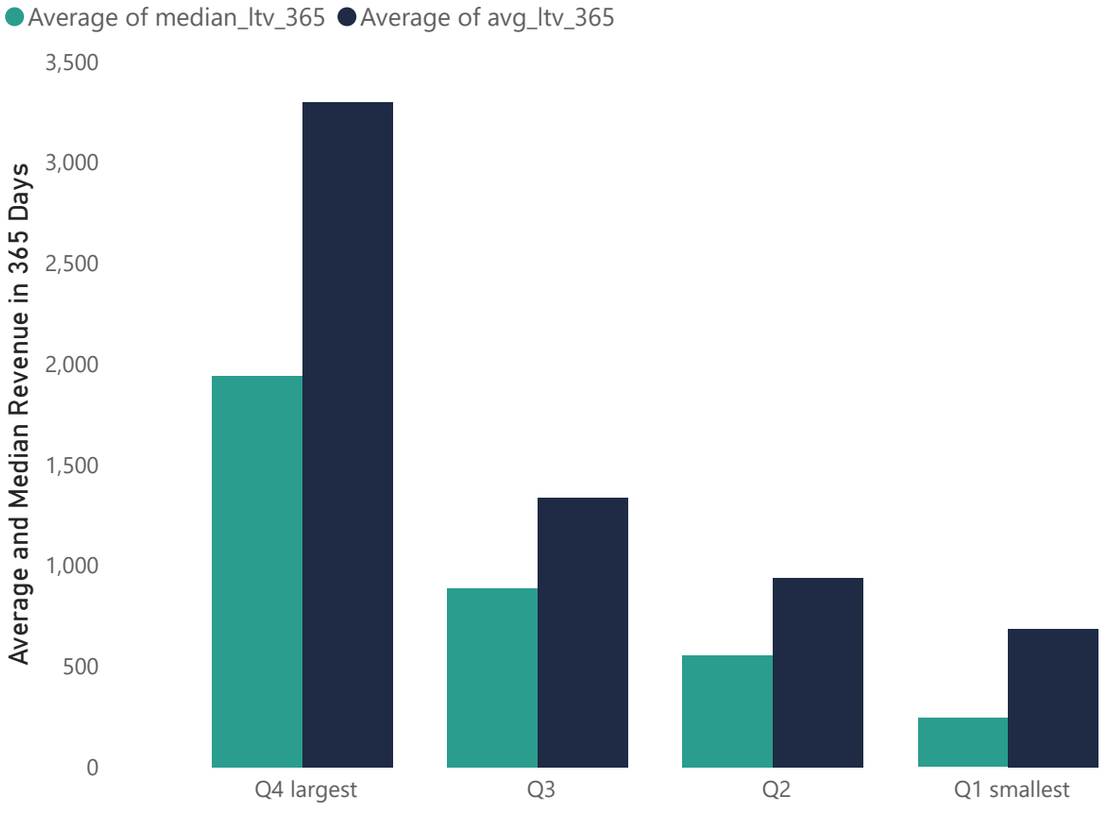

About one in five customers still orders in a given month, even a year on, which suggests a loyalty.

Customer Lifetime Value

Customer Revenue By month SInce First Purchase

365-Day Revenue By First-Order Size

£1,565 / £735

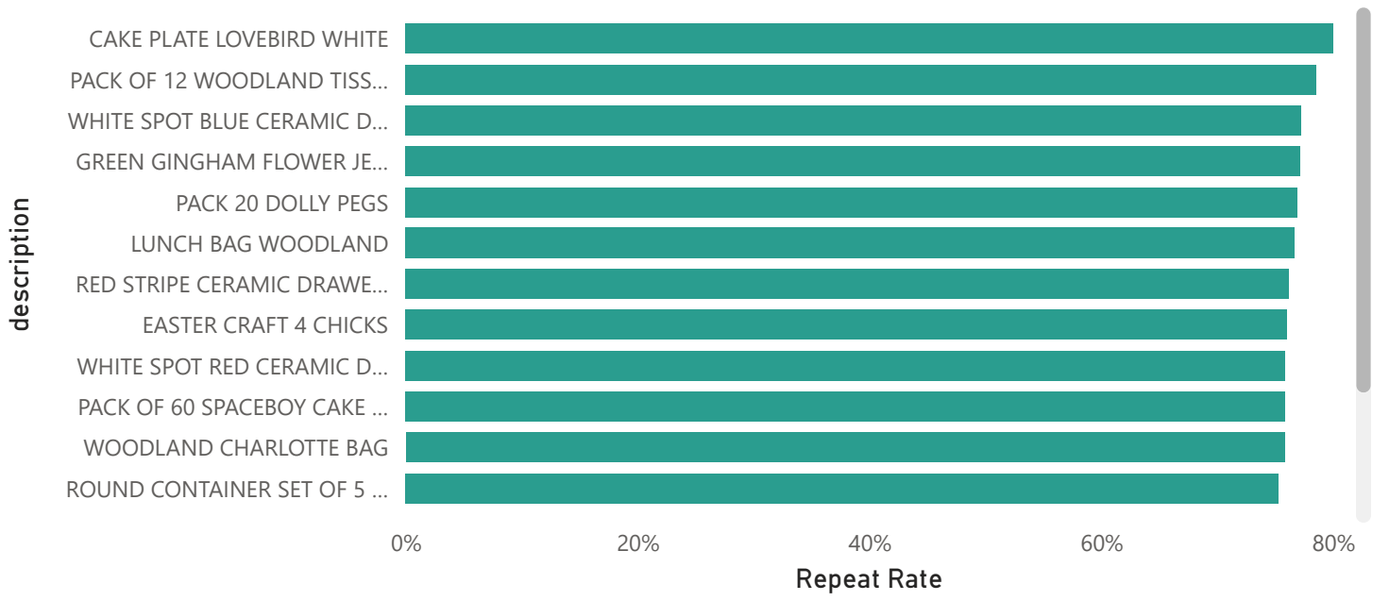

Average vs Median

Why is the average far above the median?

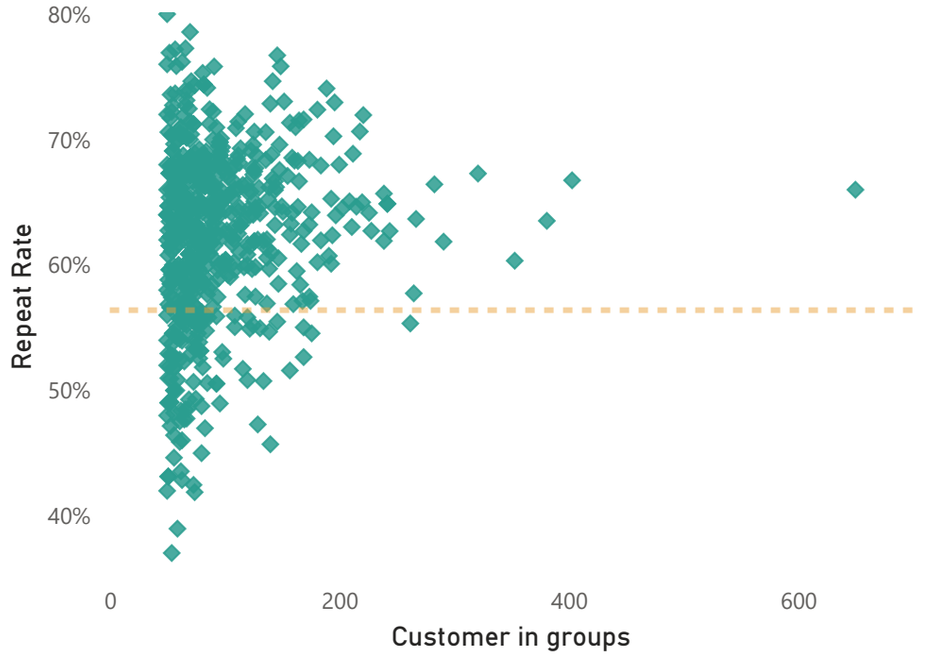

The average spent per customer is £1,565, but the median is only £735, that means half of customers spend less than that. A small number of very large buyers pull the average up.
A business that planned around the average would overestimate what a typical new customer is worth. The median is a safer guide, with the biggest accounts handled separately.

Gateway Products

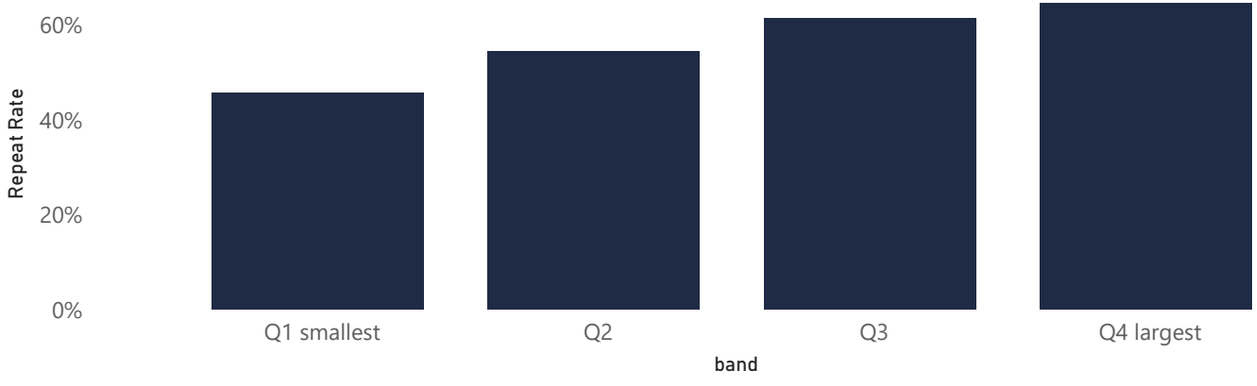

Top Product By 180- Day Repeat Rate

Group Size vs Repeat Rate

Rrepeat Rate By First Order Size

Association, not cause.

Some products show high repeat rates when they're in a customer's first order, but that doesn't mean the product makes people come back. The groups are small, 607 products were compared so some top results are luck, and products in large orders look better because large orders repeat more anyway.

- To find out whether a product really brings people back, the shop would need a test, like offering it to a random half of new customers.
